

AMP utilizes a modification of the proven wedge principle in the design of precision taper pins and matching receptacles for a wide range of circuit applications where small connector size and optimum electrical/mechanical security are critical factors. Taper pins and receptacles are self-wedging and self-cleaning, and available for use with wire sizes from 28 to 12 AWG. Taper tab receptacles are also available to mate with tabs having front end dimensions of .078" and .098".

Taper Technique products general information	23-3
Formed taper pins and receptacles.	23-8
Solid taper pins	23-13
Taper pin blocks, nylon housings, 10, 20, 30, 40, 50, 60, and 101 cavities	23-18
Insertion and extraction tools, reamer and gauges.	23-29
Taper tab receptacles, 78 and 98 Series	23-30

TAPER TECHNIQUE

Ampeconomation
COST SAVINGS BY DESIGN WORLDWIDE

INTRODUCTION

The most extensive line of taper products in the industry is made available by AMP. This includes Taper Pins, Taper Pin Receptables and Taper Blocks.

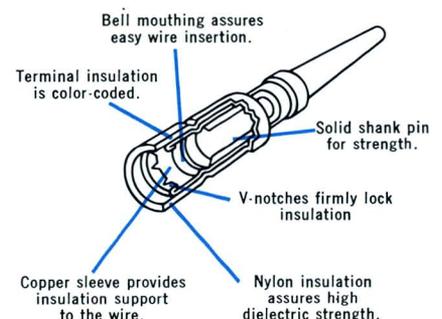

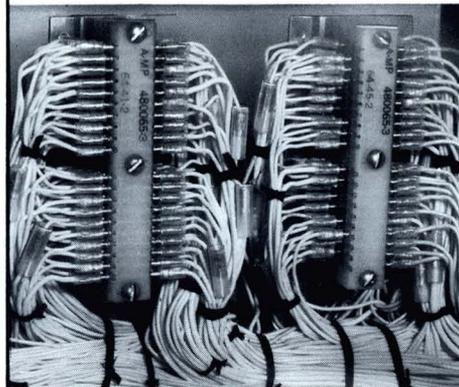

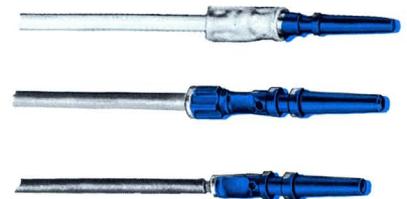

The basic appeal of these products lies in their small size, and in their capacity to deliver superior electrical and mechanical performance under the most severe operating conditions.

For purposes of size classification, the products are divided into series, with each series bearing a number corresponding to the diameter of the pin. For example, the "53" series Taper Pin has a tip diameter of .053". In construction and materials, there is considerable difference between the types of Taper Products, yet all are available with contact finishes of either gold, silver or tin plating. All are manufactured in a wide range of sizes and types to meet most every circuit requirement. However, if in considering them you feel your application calls for some special treatment of the elements involved, our engineers stand ready to help you by creating a design specifically intended to do the job you have in mind.

Taper Pins (Solid)

PIDG Pre-Insulated pins feature closed barrel, solid construction and wire support in the complete wire range from #16-#26. Screw-machined from fine grade brass, they offer exceptional mechanical and electrical characteristics and strong resistance to vibration and corrosion. A specially designed copper sleeve fitted over the barrel provides circumferential support to the wire insulation. Nylon insulation assures and maintains a high dielectric strength when crimped. The terminal is color coded to identify the wire size range. Crimping with matching AMP tooling provides maximum support for the wire. Pin is gold over nickel plated, and color coding is used to insure the proper matching of tool and wire size. This pin is also available without the insulation support.

Solid screw-machined pins are also available in an uninsulated insulation support version.

ALL DIMENSIONS IN INCHES UNLESS INDICATED OTHERWISE.

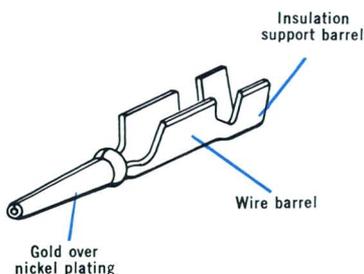

NOTE: Specifications subject to change. Consult AMP Incorporated for latest design specifications.

Taper Pins (Formed)

The only complete line of formed taper pins available in the industry, these pins are uninsulated and can be supplied with or without insulation support. Manufactured from fine grade brass and electroplated against corrosion, they meet and exceed military and commercial specifications for vibration, corrosion, heat resistance and electrical conductivity. Two versions are available.

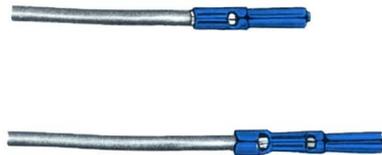

The first utilizes our "F" crimp to terminate the pins. This consists of two sides of wire barrel wrapped around the conductor strands and penetrating into the center of the strands.

The second formed pin is an insulation piercing type designed for the termination of small, stranded wires and tinsel cords. Two perpendicular lances drive through the wire insulation to make contact with the conductor, thereby eliminating the wire stripping operation. Tensile characteristics vary depending upon the type of wire insulation. Because the barrel wraps around the insulation, it deters fraying.

Taper Pin Receptacles

AMP "37" Series Taper Pin receptacles mate with taper pins .037" in diameter at the tip. The receptacle is manufactured from beryllium copper and accommodates a wire size range from #26 through #20 A.W.G. It is made with and without insulation support. Wire insulation range is .048" to .071". A long and short type are available to mate with taper pin lengths of .200" and .250". The shorter type is available in non-insulation support only.

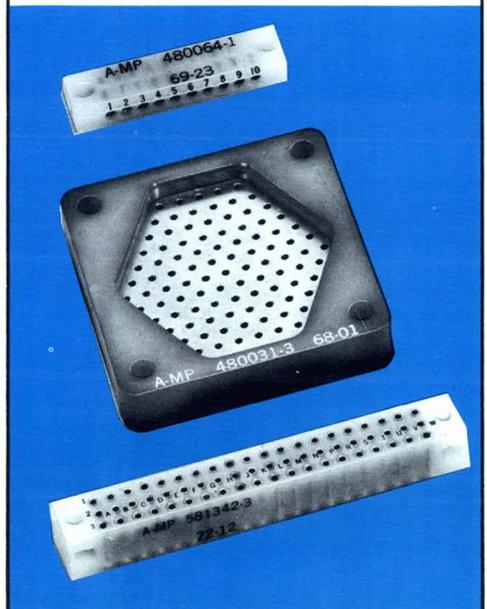

Taper Pin Blocks

Complementing the taper pin line is our extensive range of taper pin blocks. Significant contributions have been made by AMP in the development of taper blocks. With the one piece solid block, AMP offers industry the broadest and most versatile lines on the market.

For positive dielectric performance, nylon is used on all housings both solid and two piece. Inserts for the two-piece blocks are available in beryllium copper or brass, plated with tin, silver or gold.

Readily stocked, AMP Taper Blocks are made in basic units of 10, 20, 30 and 60 cavities, with any combination of single, dual or commoned taper pin receptacles in each block. Taper blocks can be — and have been — designed by AMP to meet specialized requirements.

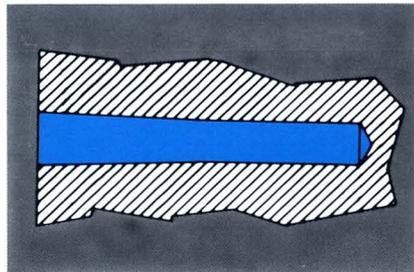

An important feature of the AMP Solid Taper Block is the recessed insert (.047" on either side) which acts as a barrier to voltage creepage. Depressed numerals clearly identify each cavity. Of equal importance is the fact that AMP has eliminated moisture entrapment in its solid taper blocks and warpage tendencies found in other two piece taper blocks.

The Technique

For simplicity and positive performance, the AMP Taper Technique has proven ideal. It provides greater freedom of design in dealing with factors of space, weight, and size. Equally important, it assures the manufacturer of uniformity and reliability throughout his connections . . . front end at our precision taper and back end at our compression-crimp.

Those using the AMP method offer ample testimony to its effectiveness. Invariably, when the full scale program is introduced, production is simplified and streamlined. Because of the "built-in" quality of our crimping tools, assembly and inspection steps are cut to a minimum. And due to the automatic application capabilities, total installed costs are substantially reduced.

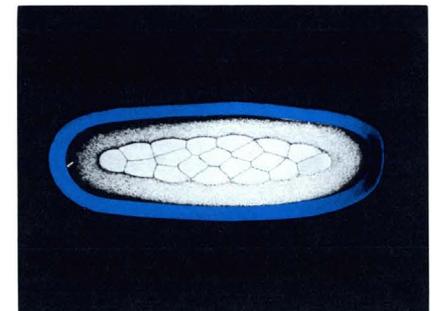

The Wedge Principle utilized in the AMP taper technique makes maximum use of space, and its 16 to 1 design — .016" length with .001" change in diameter — and makes taper pins and receptacles self-cleaning and self-locking to assure reliable performance.

The Compression Crimp

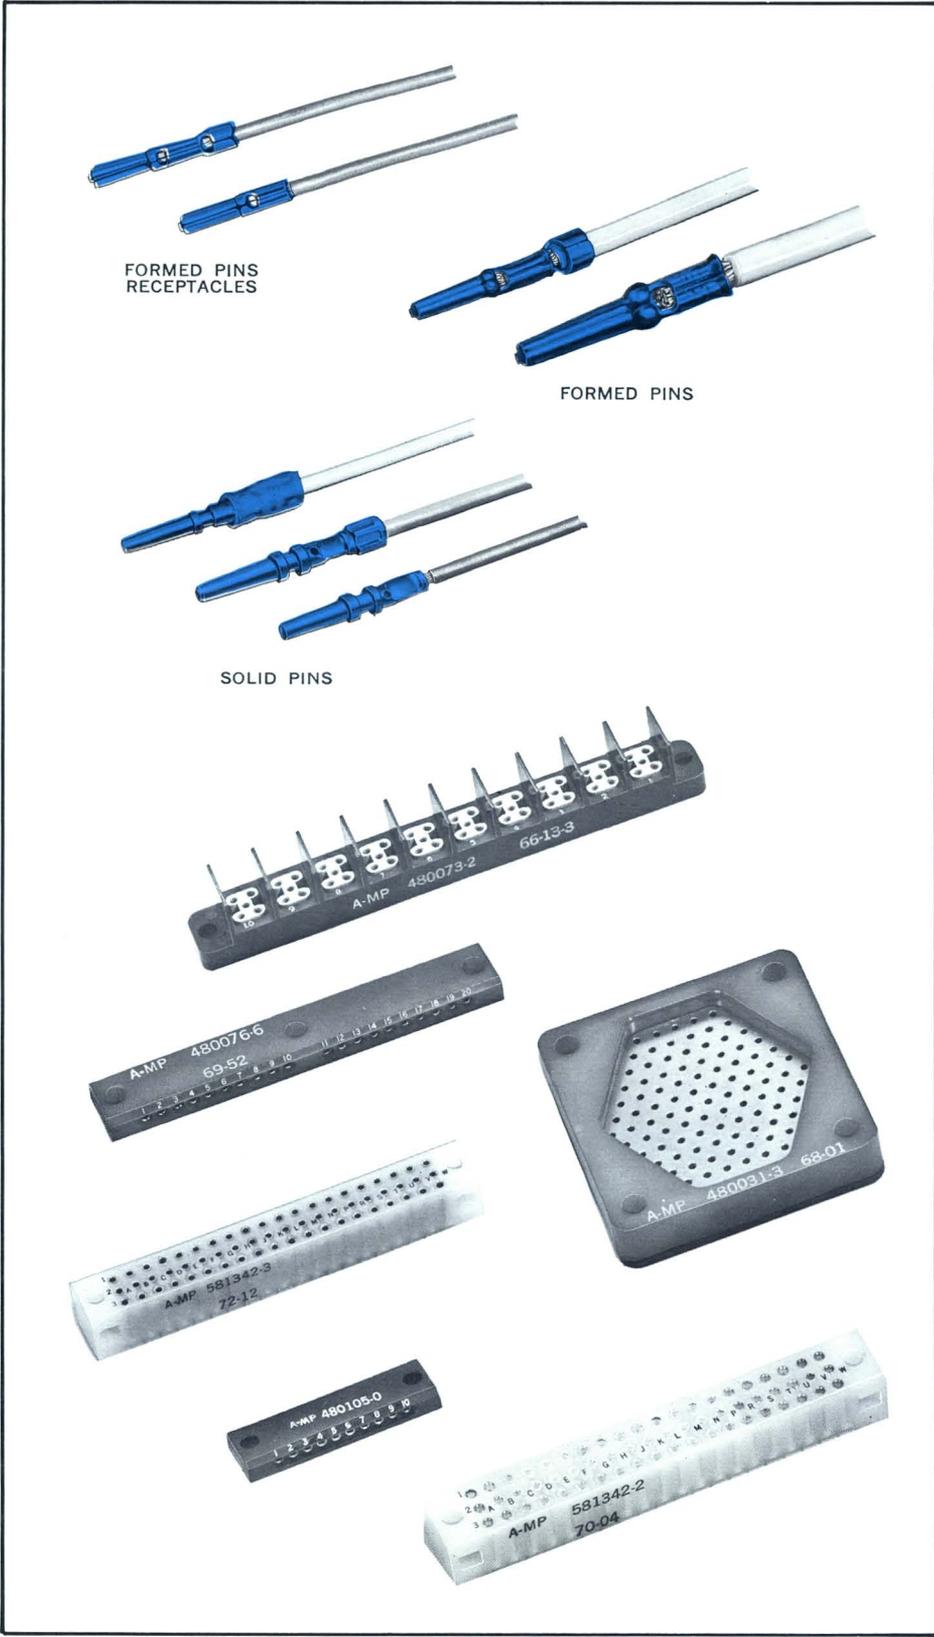

For attaching the taper pin to the electrical conductor, AMP relies on its time-proven compression-crimp technique.

This patented, industry accepted method consists of taper pin wire barrel and crimping dies fabricated to extremely close tolerances for the termination of each specific range of wire sizes.

The termination is accomplished through the application of precise, pre-calibrated pressure delivered by a variety of matching crimping tool types. With every termination the crimping dies of the tool completely "bottom" on the wire and taper pin barrel. This precision-controlled crimping action causes conductor and metal barrel to cold flow together into a homogeneous mass, creating a termination unequalled for conductivity, tensile strength, vibration and corrosion resistance. This results in identical terminations in the tens or tens of millions.

TABULAR DATA

The following tabular data provides you with a simple method of determining the number of the part that meets your individual performance requirements.

The entire tabular section is categorized: Formed Taper Pins & Receptacles, Solid Taper Pins, Taper Block Section and Tooling. Tables under these categories are presented by "Series"—pin or receptacle size. For pins and receptacles, tables are further divided by type—pre-insulated, uninsulated, etc.—and for taper blocks, by the amount of cavities each block contains.

Further divisions within each table are clearly indicated in the headings of the table.

FINISH CODE

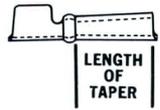

(applies to Pins and Receptacles on pages 23-8 thru 23-17)

AMP offers a wide variety of finishes for taper pins and receptacles. Each table in the tabular data section includes a "FINISH" column which contains the name of the generic finish and a superior numeral, i.e., "Gold⁵". The specific plating materials and thicknesses are listed at the right. For detailed test and performance data on AMP plating, contact your AMP District Sales Engineer or AMP Incorporated, Harrisburg, Pa.

*Material of above pins is leaded commercial bronze.

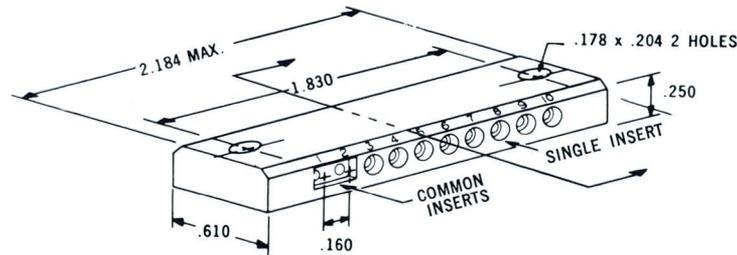

TAPER BLOCK SECTION

HORIZONTAL IN-LINE TYPE (10, 20, 30 and 60 CAVITIES)

(Note: References under remarks column: S = Single, C = Common)

All block material Nylon unless otherwise indicated.

All assemblies have standard cavity identification unless otherwise noted.

SECTION TYPICAL FOR 10, 20 AND 30 POSITION BLOCKS.

"53" SERIES

AMP Taper Tab Receptacles, 78 and 98 Series

Precision formed taper tab receptacles are available to mate with tabs having front end dimensions of .078" and .098". These receptacles are available in strip form, reel fed for high speed automatic machine termination or in loose piece for hand tool termination for limited production and maintenance and repair.

Manufactured from fine grade brass AMP taper tab receptacles are provided in choice of tin, silver or gold plating, with or without insulation support. The basic termination is accomplished by the AMP "F" crimp that wraps the two sides of the wire barrel around the conductor strands and penetrates into the center to form a homogeneous mass.

This type termination exhibits excellent electrical and mechanical characteristics, showing a high tensile strength that is vibration resistant.

To terminate small tensile cord the 78 series is available in an insulation piercing type. During the crimping operation, two perpendicular lances are driven through the wire insulation to make positive contact with the conductor.

This eliminates the tedious pre-stripping operation and greatly increases production rates. Since tensile characteristics vary depending on the type of wire insulation, it is recommended that samples of your wire be submitted to AMP Incorporated for evaluation.

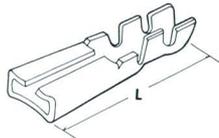

Features

- Precision formed, reel-fed for high speed automatic machine application
- "F" crimp, positive termination
- Insulation piercing crimp available for tensile cord—eliminates pre-stripping (78 series only)
- Choice of insulation support and non-insulation support
- Tin, silver or gold plated brass available
- 78 series accepts wire sizes 30 solid, 24-22 and 20-18 AWG
- 98 series accepts wire sizes 24-22, 24-20 and 20-18 AWG

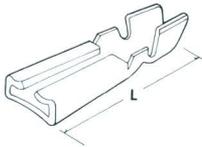

Note: All dimensions in inches. Specifications subject to change. Consult AMP Incorporated for latest design specifications.

Tooling

AMP-O-LECTRIC Automatic Machine

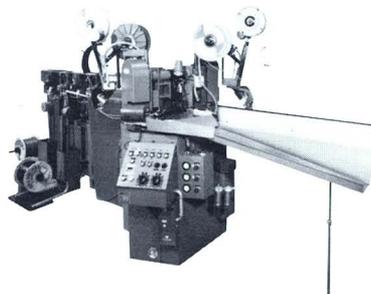

Bench-mounted, electrically operated from any standard factory outlet. Actuated by foot-pedal or by electronic switch in crimping area which is tripped when wire is in proper crimping position. Designed to install a wide range of AMP Terminals on a wider range of wire sizes.

Production Speed: Up to 4,000 terminations per hour.

AMPOMATOR Automatic Machine

AMPOMATOR Automatic Machine is the ultimate in automatic lead-making equipment. Lead lengths can vary from 1.62" to 190" and no operator wire feed is necessary. Machine, electrically operated, cuts wires to proper length, strips one or both ends and crimps terminals to either or both ends... automatically.

Production Speed: Up to 5700 finished leads per hour-11,400 terminations, one on each end of lead, per hour on short leads 3" to 10".

AMP Side-Feed Miniature Applicator

Can be used in the AMPOMATOR or AMP-O-LECTRIC machine. Provides quick change-over from one terminal

to another. All adjustments are made rapidly cutting production down time. Crimping height on contact barrel for a given wire size is simply "dialed in."
